

A New Perspective Of Old Values

Peter G. Goral, Director of Marketing

Peter

As the newest addition to the leadership team here at Infoglen I feel I must acknowledge and pass on some insights to the team while my perspective is still fresh.

Much like many of you, I grew up with the idea that a business was a building, and that building had an owner, a boss if you will, and that person hired a group of people, usually individuals who would do as they were told because they either wanted and/or needed the job.

As I matured in my career, and actually became one of those so-called bosses, I found myself echoing the sentiment of the business owner as that quite honestly,

was the best way for me to keep my job and hopefully get promoted to a higher and maybe even a better paying position. Boy, how short-sighted that was of me.

Then came the reality in what I can safely label as mid-life when the pressures of an ever-growing globally competitive marketplace affected every business and the people were thought of as “headcount”, you have no idea how badly I despise that term, and the stress of the economics found the likes of myself along with many in the world of work considered redundant. It was never personal, it was just business they used to say, (another one of the most disturbing comments to me).

Today as we welcome the growth of the “gig economy” where intelligence and good customer service now outweighs the size of any business, I’m feeling rejuvenated and now living my very best life as someone who is appreciated for having survived those old-fashioned days of business and I welcome the new world of work. A place where people mean more than the buildings, in fact you’ll be happy to know that businesses are not and never were those buildings. Businesses have in many instances matured and are removing the barriers once created by those micromanaging bosses. The very best examples of those bosses have now taken up the new role of leader, a position that is in fact, not exclusive to them as the business owner.

Oh, how times have changed, and how fortunate I am to have found a group of people who believe in the old values of great customer service, and who think of people as partners and allies as opposed to workers who can be dismissed at will.

A business is and will always be the collective of people that goes about their day focused as one toward a very simple goal of partnering with and enhancing the client’s business. So, you can imagine my pleasure when I first met with Haroon and Saba and found that synergy in thought, and heart, and what a bonus it was to discover a magnificent group of empowered people working toward those very same goals. I can honestly tell you that I have not come across a company that operates like this in the past 20 years. You are all to be congratulated and commended for having the foresight and the heart to understand that YOU are the business, and that the growth and success of the company lies intimately in your hands.

Thank you everybody for the warm welcome you gave me last month, and I am honoured to be a part of this collective called Infoglen.

Insight

Lightning Web Components

Shrikant from Pune team shares with us the power of LWC, the new programming model

Lightning Web Components is a new programming model for building Lightning Components. It leverages the web standards breakthrough of the last five years, can coexist and interoperate with the original Aura programming model and delivers unparalleled performance.

Shrikant

Main advantages of using LWC

- ✔ **Avoid Server Calls**
The main advantage of Salesforce Lightning is that we can avoid many server calls while working with Lightning Components and the reason behind this is the JS controller using JS we can manipulate the data into the controller and display as per our need.
- ✔ **Faster Development**
Empowers teams to work faster with out-of-the-box components that function seamlessly with desktop and mobile devices. Building an app with components facilitates parallel design, improving overall development efficiency.
- ✔ **Device-aware and cross-browser compatibility**
Apps use responsive design and provide an enjoyable user experience. The Lightning Component framework supports the latest in browser technology such as HTML5, CSS3, and touch events.
- ✔ **Event-driven architecture**
It uses an event-driven architecture for better decoupling between components. Any component can subscribe to an application event, or to a component event they can see.
- ✔ **SLDS**
SLDS means Salesforce Lightning Design System that gives you the power to style the component in your way, develop component as per your look and feel and you do not need to worry about responsive behavior it will take care all itself.
- ✔ **2 Way Binding**
It is one of the Salesforce lightning features that made me go “Wow” i.e. the two-way binding changes in the application state have been automatically reflected in the view and vice-versa. In fact, we could build our own directives with two-way data bound scope properties, by setting a configuration value.
- ✔ **Avoids ViewState Error**
Another awesome feature is that we will never get view state error while working with the Lightning Component.
- ✔ **Lightning OUT**
Here comes the true power of Salesforce Lightning that is Lightning OUT which gives you the power to take your Lightning Component to an external site and this is the thing that enables you to show Lightning Component into VF page.
